1. Scope

The Wireless Application Protocol (WAP) is a result of continuous work to define an industry-wide specification for developing applications that operate over wireless communication networks. The scope for the WAP Forum is to define a set of specifications to be used by service applications. The wireless market is growing very quickly, and reaching new customers and services. To enable operators and manufacturers to meet the challenges in advanced services, differentiation and fast/flexible service creation WAP Forum defines a set of protocols in transport, security, transaction, session and application layers. For additional information on the WAP architecture, please refer to "*Wireless Application Protocol Architecture Specification*" [WAPARCH].

Provisioning is the process by which a WAP client is configured with a minimum of user interaction. The term covers both OTA provisioning and provisioning by means of, e.g., SIM cards. A WAP client may, for example, be provisioned with connectivity and application information by pushing configuration parameters over the air from a server to a WAP client. This specification defines the content encoding by what configuration parameters are presented to the WAP client in the provisioning framework. The content encoding is defined in terms of binary XML [WBXML] and is interpreted and handled at the application level of the WAP architecture. However, the handling and use of provisioned information is outside the scope of this specification.

For an overview of the provisioning process architecture, please refer to "Wireless Application Protocol Provisioning Architecture Overview Specification", [PROVARCH].

3. Terminology and Conventions

3.1. Conventions

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

All sections and appendixes, except “Scope”, are normative, unless they are explicitly indicated to be informative.

3.2. Definitions

Address Domain

~~IP Domain or URL Domain~~

Characteristics

This document uses the term characteristics to define the characteristics of, typically, a Network Element (access point, proxy). The word is broad enough to be used in all the required contexts.

Configuration Context

A Configuration Context is a set of connectivity and application configurations typically associated with a single TPS. However, the Configuration Context can also be independent of any TPS. A TPS can be associated with several Configuration Contexts, but a TPS cannot provision a device outside the scope of the Configuration Contexts associated with that particular TPS. In fact, all transactions related to provisioning are restricted to the Configuration Contexts associated with the TPS.

Connectivity document

~~A particular instance of a XML document encoded according to this specification. The MIME type of the textual document is *text/vnd.wap.connectivity+xml*. The MIME type of the tokenized document is *application/vnd.wap.connectivity-wbxml*.~~

Connectivity Information

This connectivity information relates to the parameters and means needed to access WAP infrastructure. This includes network bearers, protocols, access point addresses as well as proxy addresses and Trusted Provisioning Server URLs.

Default Proxy

The default proxy, or home proxy, defines the preferred proxy of the configuration context. The preferred proxy is defined by the largest domain scope, and in case of conflict, is defined by the highest priority. Priority is defined as a function of order of discovery.

Domain description

The navigation and configuration information defines addresses and access parameters to connect to proxies.

Each proxy can serve one or more domains. The DOMAIN can be a partial URL, expressing wildcard characteristics.

www.service.com/protected/

www.service.com/

.service.com/

The DOMAIN of the proxy is defined as a parameter of the proxy characteristic.

Logical Proxy

A logical proxy is a set of physical proxies that MAY share the same WSP and WTLS context (shared session id value space). This implies that physical proxies within a logical proxy share the same WSP and WTLS session cache. For example, the device does not have to create a new WTLS session when switching from CSD to SMS if the target is the same logical proxy.

Network Access Point

A physical access point is an interface point between the wireless network and the fixed network. It is often a RAS (Remote Access Server), an SMSC, a USSDC, or something similar. It has an address (often a telephone number) and an access bearer.

Physical Proxy

A physical proxy is a specific address with a proxy functionality. It can be the IP address plus port for an IP accessible proxy, or the SME-address plus port for an SMS accessible proxy.

Provisioning document

A particular instance of a XML document encoded according to this specification. The MIME-type of the textual document is *text/vnd.wap.connectivity-xml*. The MIME-type of the tokenized document is *application/vnd.wap.connectivity-wbxml*.

Proxy Discovery Mechanism

A mechanism used to inform the client device that it should use another proxy to access the requested information.

Trusted Provisioning Server

A TPS, Trusted Provisioning Server (TPS), is a source of provisioning information that can be trusted by a Configuration Context. They are the only entities that are allowed to provision the device with static configurations. In some cases, however, a single TPS is the only server allowed to configure the phone. Provisioning related to a specific TPS is restricted to Configuration Contexts that are associated with this TPS.

Trusted Proxy

The trusted (provisioning) proxy has a special position as it acts as a front end to a trusted provisioning server. The trusted proxy is responsible to protect the end-user from malicious configuration information.

WAP Proxy

The WAP proxy is an endpoint for the WTP, WSP and WTLS protocols, as well as a proxy that is able to access WAP content. A WAP Proxy can have functionality such as that of, for example, a WSP Proxy or a WTA Proxy.

WSP Proxy

A generic WAP proxy, similar in functionality to a HTTP proxy. It is a variant of a WAP Proxy.

WTA Proxy

The WTA Proxy is a Wireless Telephony proxy as defined by WAP.

3.3. Abbreviations

APN	Access Point Name
CDPD	Cellular Digital Packet Data
CHAP	Challenge Handshake Authentication Protocol
CSD	Circuit Swithed Data
DNS	Domain Name System
DTD	Document Type Definition
GHOST	GSM Hosted SMS Teleservice
GPRS	General Packet Radio Service
<u>GSM</u>	<u>Global System for Mobile communications</u>
GUTS	General UDP Transport Service
HTTP	HyperText Transfer Protocol
IP	Internet Protocol
ITSI	Individual TETRA Subscriber Identity
MAN	Mobitex Subscription Number
ME	Mobile Equipment
MIME	Multipurpose Internet Mail Extensions
NAP	Network Access Point
OTA	Over The Air

PAP	Password Authentication Protocol
PDP	Packet Data Protocol
RAS	Remote Access Server
SDS	Short Data Service
SID	System Identity
SIM	Subscriber Identity Module
SME	Short Message Entity
SMS	Short Message Service
SMSC	Short Message Service Centre
SOC	System Operator Code
TETRA	Terrestrial Trunked Radio
TPS	Trusted Provisioning Server
<u>UDP</u>	<u>User Datagram Protocol</u>
URI	Uniform Resource Identifier
URL	Uniform Resource Locator
USSD	Unstructured Supplementary Service Data
USSDC	Unstructured Supplementary Service Data Centre
WAP	Wireless Application Protocol
WBXML	WAP Binary XML
WSP	Wireless Session Protocol
WTA	Wireless Telephony Application
WTLS	Wireless Transport Layer Security
WTLS-SS	WTLS Shared Secret
WTP	Wireless Transaction Protocol
XML	Extensible Mark-up Language

4. Architectural Overview

ConnectivityProvisioning documents are binary encoded XML documents [WBXML] with a special MIME type that is interpreted at the application level on the ME. The handling and use of the provisioned information is outside the scope of this specification.

The XML DTD defines two elements; a CHARACTERISTIC element and a PARM element. The PARM element is used to provide values for the individual parameters, while the CHARACTERISTIC element is used to group parameters into logical entities that are related to a specific characteristic of the configuration space. Section 4.1 defines the XML DTD.

The configuration space may be defined in terms of the following main characteristics: Parameters related to logical proxies, parameters related to physical proxies, parameters related to network access points (NAPs), parameters related to the bootstrap process, parameters related to (ME) vendor specific configuration and parameters related to Client Identity. Additional characteristics may easily be added later by defining new characteristic types and parameter names. ME implementations MUST be designed with this in mind. An overview of the data model is presented in section 4.2.

Connectivity provisioning has been defined so that each connectivityprovisioning document must be complete in the sense that information provided in one document cannot rely explicitly on information provided in another document. For example, if a physical proxy is to be used with a specific NAP, this NAP must be defined in the same connectivityprovisioning document. Implicit reference to information defined in other documents is allowed. This is, for example, the case when using the INTERNET as a value for the TO-NAPID parameter, which means that reference is made to an arbitrary NAP definition that has an INTERNET parameter specified.

Logical proxies (the PXLOGICAL characteristic) have a number of physical instances, i.e., physical proxies (the PXPHYSICAL characteristic). Each logical proxy has a name, an unique ID, a startpage URL, and some parameters like port number values that are shared between all physical instances of the logical proxy.

Each proxy may serve one or several URL domains. Proxies may also vary in the protocols and services they support. To this end, PORT characteristics may be provided so that bindings between port numbers and protocols or services can be defined for each proxy.

The physical proxies refer to a number of NAP definitions (the NAPDEF characteristic), which can be used with the physical proxy in question. A NAPDEF characteristic has to supply definitions for all the parameters that are relevant to a particular NAP.

In the sections to follow, each of the characteristics and their associated parameters will be described along with the restrictions that apply to the occurrence and values of the parameters.

4.1. ConnectivityProvisioning Reference Information

ConnectivityProvisioning is an application of [XML] version 1.0. An implementation conforming to this specification MUST support the WAP-PROVISIONINGDOC DTD defined in this chapter.

4.1.1. Document Identifiers

4.1.1.1. SGML Public Identifier

-//WAPFORUM//DTD PROV 1.0//EN

4.1.1.2. Connectivity Media Type

Textual form:

text/vnd.wap.connectivity-xml

Tokenized form:

application/vnd.wap.connectivity-wbxml

4.1.2. Document Type Definition

The connectivityprovisioning document format is based on a very simple XML DTD:

```
<!--
ConnectivityProvisioning Document Type Definition
ConnectivityProvisioning is an XML language. Typical Usage:

<?xml version="1.0"?>
<!DOCTYPE wap-provisioningdoc PUBLIC "http://www.wapforum.org/DTD/prov.dtd">
<wap-provisioningdoc>
...
</wap-provisioningdoc>
-->

<!ELEMENT wap-provisioningdoc (characteristic+)>
<!ATTLIST wap-provisioningdoc
      version   CDATA #IMPLIED
>

<!ELEMENT characteristic (parm*, characteristic*)>
<!ATTLIST characteristic
      type     CDATA #REQUIRED
>

<!ELEMENT parm EMPTY>
<!ATTLIST parm
      name    CDATA #REQUIRED
      value   CDATA #IMPLIED
>
```

4.2. Overview of Data Model

The above XML DTD provides a flexible and extensible framework for parsing configuration parameters by means of PARM elements grouped by CHARACTERISTIC elements. The description of each of the possible PARM values and CHARACTERISTIC types is given in the following sections, while a short structural overview of the data model is given here.

The notation is such that **bold underlines** indicates parameters used for links, *italic* indicates parameters affected by external events, plus (+) indicates that the parameter can occur 1 or more times, star (*) indicates that the parameter can occur 0 or more times, question mark (?) indicates that the parameter can occur 0 or 1 times, empty () indicates that the parameter is required within the scope of the encapsulating characteristic and that it can occur only once.

```

  }
}

```

4.3. Media Type Parameter

The connectivity media type may contain security information, which is transported as parameters to the media type *application/vnd.wap.connectivity-wbxml*. The security information consists of the message authentication code and the security method. The parameters MAC and SEC have been defined for this purpose and these MUST be supported by the WAP client.

Parameters

SEC

The parameter specifies the security mechanism used (if it is not present, no security is used). If present it MUST take one of the values USERPIN, USERPINMAC, NETWPIN, USERNETWPIN ([PROVBOOT]). If the parameter MAC is provided, the parameter SEC MUST also be present.

The parameter SEC can have the following values:

Value	Meaning
0	NETWPIN
1	USERPIN
2	USERNETWPIN
3	USERPINMAC

MAC

This parameter contains an even number of (upper case) hexadecimal digits used to authenticate the sender of the document and ensure integrity of the document. Quote characters MUST NOT be placed around the parameter value. The calculation of the MAC is defined in other provisioning specifications, such as the "WAP Provisioning Bootstrap Specification" ([PROVBOOT]).

4.4. The WAP-PROVISIONINGDOC element

This element encapsulates all the provisioned information. It has the following attribute:

Attribute

version

An optional attribute that contains version information. The version for the current specification is the string "1.10". A ME MUST only use documents that either do not have this attribute or have a version number which matches the major version number of the provisioning content type that the ME understands.

Increase of the minor version number indicates that the changes introduced are backward compatible with the previous version(s), whereas increase of the major version number indicates introduction of non-backward compatible changes.

4.5. The CHARACTERISTIC element

This element is used to group the provisioned information into logical units. It has a required type attribute, which can take on the following values:

Attributes

type

PXLOGICAL, PXPHYSICAL, PXAUTHINFO, PORT, NAPDEF, NAPAUTHINFO, VALIDITY, BOOTSTRAP, CLIENTIDENTITY, VENDORCONFIG, APPLICATION, APPADDR, APPAUTH, RESOURCE.

A characteristic of a particular type can only accept certain parameters, and parameters defined in one characteristic can generally not be overwritten by another.

Value	Meaning
PXLOGICAL	Definition of a logical proxy
PXPHYSICAL	Definition of a physical proxy
PXAUTHINFO	Definition of authentication information within a logical proxy
PORT	Defines port bindings
NAPDEF	Definition of a Network Access Point
NAPAUTHINFO	Definition of authentication information within a network access point
VALIDITY	Defines country, network, and/or period of time where a certain NAPDEF is valid
BOOTSTRAP	Defines parameters relevant for bootstrapping
CLIENTIDENTITY	Defines the client-ID
VENDORCONFIG	Vendor specific configuration
<u>APPLICATION</u>	<u>Definition of general application specific parameters.</u>
<u>APPADDR</u>	<u>Definition of application address information.</u>
<u>APPAUTH</u>	<u>Definition of application authentication information.</u>
<u>RESOURCE</u>	<u>Definition of resources within an application.</u>

4.5.1. Characteristics of type PXLOGICAL

PXLOGICAL characteristics define logical proxies and may only occur at the root of a connectivityprovisioning document. This characteristic MUST be supported by the WAP client.

4.5.2. Characteristics of type PXPHYSICAL

PXPHYSICAL characteristics convey information on physical instances of a logical proxy and should be listed according to priority inside a PXLOGICAL characteristic. The ME MAY choose to rely on the so defined priority to select a physical proxy. The ME MAY reuse WTLS sessions with all PXPHYSICAL defined in the scope of a single PXLOGICAL. For WSP sessions, on the other hand, the ME MAY use the suspend/resume functionality to move sessions between any of these physical proxies. This characteristic MUST be supported by the WAP client.

4.5.3. Characteristics of type PXAUTHINFO

PXAUTHINFO characteristics define the binding between a proxy authentication method and its corresponding authentication parameters. It may only occur within a PXLOGICAL characteristic.

4.5.4. Characteristics of type PORT

PORT characteristics define the binding between a port number and one or more protocols or services. It may only occur in PXLOGICAL, PXPHYSICAL, and APPADDR characteristics. This characteristic MUST be supported by the WAP client.

4.5.5. Characteristics of type NAPDEF

NAPDEF characteristics define network access points and may only occur at the root of a connectivityprovisioning document. This characteristic MUST be supported by the WAP client.

4.5.6. Characteristics of type NAPAUTHINFO

NAPAUTHINFO characteristics define the binding between an authentication method and its corresponding authentication parameters. It may only occur at the root of a NAPDEF characteristic.

4.5.7. Characteristics of type VALIDITY

The VALIDITY characteristic indicates the range (in time as well as in terms of country and network codes) where a certain NAPDEF is valid. It may only occur at the root of a NAPDEF characteristic.

4.5.8. Characteristics of type BOOTSTRAP

The BOOTSTRAP characteristic is used to define parameters of use during the bootstrap process. This characteristic may only occur within the root of the connectivityprovisioning document.

4.5.9. Characteristics of type CLIENTIDENTITY

ClientIdentity CLIENTIDENTITY characteristics define a global identity. It may only occur at the root of a connectivityprovisioning document.

4.5.10. Characteristics of type VENDORCONFIG

The VENDORCONFIG characteristic is used for (ME) vendor specific provisioning. It may only occur at the root of a connectivityprovisioning document.

4.5.11. Characteristics of type APPLICATION

The APPLICATION characteristic is used to define application protocol parameters and to describe the attributes of an application service access point available using the protocol. This characteristic may only occur within the root of the connectivity document.

4.5.12. Characteristics of type APPADDR

The APPADDR characteristic is used to define address parameters for an application protocol. This characteristic may only occur within the APPLICATION characteristic.

4.5.13. Characteristics of type APPAUTH

The APPAUTH characteristic is used to specify authentication parameters related to an APPLICATION characteristic. This characteristic may only occur within the APPLICATION characteristic.

4.5.14. Characteristics of type RESOURCE

The RESOURCE characteristic is used to describe the resources available at an application service access point and access parameters related to them. This characteristic may only occur within the APPLICATION characteristic.

4.6. The PARM element

The PARM element is a general purpose slot for various parameters of each characteristic. The attribute NAME of the element defines the usage of the element.

A parameter with a type that does not add value can be omitted from the definition. For example, if proxy authentication is not performed then the parameter PXAUTH-TYPE can be omitted, and subsequently the parameters PXAUTH-ID and PXAUTH-PW can also be omitted. Some parameters, like the DOMAIN parameter, can be used multiple times within the characteristic.

The PARM element MAY be used for providing provisioning parameters specific to an application service or application protocol. However, these SHOULD be registered with WINA [WINA] to guarantee interoperability. The details on how the parameters defined in this specification are used SHOULD be registered with WINA, too.

Attributes

name

The NAME of the parameter. Permitted values depend on the type of characteristics the PARM element is a sub-element of.

value

The VALUE of the parameter. Permitted values depend on the NAME attribute of the element.

4.6.1. Parameters for PXLOGICAL characteristics

The PXLOGICAL characteristic indicates the name and parameters needed to access a particular logical WAP Proxy from the wireless terminal. The PXLOGICAL characteristic is linked to a NAPDEF element to provide all the necessary access information. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters

PROXY-ID

The PROXY-ID is used to define one logical WAP proxy entity. It is also used to link a proxy to session and security contexts. A PROXY-ID MUST be globally unique. Uniqueness MUST be obtained by either using a fully qualified Internet domain name (i.e. hostname as defined in section 3.2.2 of [RFC2396]) or a globally unique IP address (IPv4 [RFC791] in decimal format with dots as delimiters or IPv6 [RFC2373], as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters). This parameter MUST be supported by the WAP client.

PROXY-PW (0 or 1 entries)

The PROXY-PW indicates the authentication password for the proxy. PROXY-ID and PROXY-PW are used as authentication parameters for push proxy authentication to the client. This parameter MUST be supported if the client supports OTA-HTTP services.

PPGAUTH-TYPE (0 or 1 entries)

The PPGAUTH-TYPE parameter links the PROXY-ID and PROXY-PW to an authentication method. Possible values are "HTTP-BASIC" and "HTTP-DIGEST" [PushOTA]. This parameter MUST be supported if the client supports OTA-HTTP services.

PROXY-PROVIDER-ID (0 or 1 entries)

The PROXY-PROVIDER-ID is used to verify the identity of a proxy when using certificate based server authentication. If server certificate authentication is used, and the PROXY-PROVIDER-ID has been defined, then service credentials of the certificate MUST match the PROXY-PROVIDER-ID. The format MUST be either a fully qualified Internet domain name (i.e. hostname as defined in section 3.2.2 of [RFC2396]) or a globally unique IP address (IPv4 [RFC791] in decimal format with dots as delimiters or IPv6 [RFC2373], as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters).

NAME

The NAME indicates a logical, user readable, identity (property) of the configuration element. This parameter MUST be supported by the WAP client.

DOMAIN (0 to 4 entries)

The DOMAIN parameter indicates a domain, for which the proxy is responsible. The proxy might support multiple domains. The DOMAIN parameter MUST be either in the syntax described in [PROVUAB] or an absolute URI [RFC2396]. If the DOMAIN parameter contains an IPv4-address, it MUST be given in decimal format with dots as delimiters as defined in [RFC2396]. If the DOMAIN parameter contains an IPv6-address [RFC2373], it MUST be given as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters. If the DOMAIN parameter is missing, this MUST be interpreted as if an empty value was given. This parameter MUST be supported by the WAP client.

TRUST (0 or 1 entries)

The TRUST can be used to define that a particular proxy is trusted. For example, provisioning information received from the trusted proxy can be accepted. Note that it is possible that the user does not have a trusted proxy. The trusted proxy does not have to be the home (default) proxy. The parameter does not take a value.

MASTER (0 or 1 entries)

The MASTER is used to define that a particular proxy is allowed to send navigation documents to the device, using the Proxy Discovery Mechanism defined in [E2ESEC]. The parameter does not take a value.

STARTPAGE (0 or 1 entries)

The STARTPAGE parameter MUST be an absolute URI [RFC2396] and defines the homepage or start page associated with the services accessible from the proxy. The STARTPAGE MAY be used to provide different services to different users. If the scheme is missing from the STARTPAGE parameter, then "http" is assumed. This parameter MUST be supported by the WAP client.

BASAUTH-ID (0 or 1 entries)

The BASAAUTH-ID indicates the basic authentication identifier for the startpage. This parameter MUST be supported by the WAP client.

BASAUTH-PW (0 or 1 entries)

The BASAAUTH-PW indicates the basic authentication password for the startpage. This parameter MUST be supported by the WAP client.

WSP-VERSION (0 or 1 entries)

The WSP-VERSION indicates the WSP encoding version that the proxy in question supports. The format of this parameter is an integer representing the major version number followed by a “.” and an integer representing the minor version number. If the parameter is not present or if no value is given, then the default value 1.2 should be assumed.

PUSHENABLED (0 or 1 entries)

This parameter takes one of the values 0 or 1. If the value is 1 for a given logical proxy, this proxy will support push. The ME is consequently advised to enable push. If the value is 0 for a given logical proxy, this proxy will not support push. If the parameter is not present or if no value is given, then the default value 0 should be assumed. The parameter is advisory only and an ME might override the recommendation. In particular, it MUST be ignored if a SERVICE associated with the proxy always supports push.

PULLENABLED (0 or 1 entries)

This parameter takes one of the values 0 or 1. If the value is 1 for a given logical proxy, this proxy will support pull. If the value is 0 for a given logical proxy, this proxy will not support pull. If the parameter is not present or if no value is given, then the default value 1 should be assumed. The parameter is advisory only and an ME might override the recommendation. In particular, it MUST be ignored, if a SERVICE associated with the proxy always supports pull.

4.6.2. Parameters for PXPHYSICAL characteristics

The PXPHYSICAL characteristic is only allowed to be used within the characteristic of a logical PROXY. Note that the parameters listed below are described in the scope of this particular characteristic.

*Names and values of parameters***PHYSICAL-PROXY-ID**

The PHYSICAL-PROXY-ID is used to define one physical WAP proxy entity. The PHYSICAL-PROXY-ID MUST be unique within its enclosed structure, i.e. within the PXLOGICAL characteristic. This parameter MUST be supported by the WAP client.

DOMAIN (0 to 4 entries)

The DOMAIN parameter indicates a domain, for which the proxy is responsible. The proxy might support multiple domains. The DOMAIN parameter MUST be either in the syntax described in [PROVUAB] or an absolute URI [RFC2396]. If the DOMAIN parameter contains an IPv4-address, it MUST be given in decimal format with dots as delimiters as defined in [RFC2396]. If the DOMAIN parameter contains an IPv6-address [RFC2373], it MUST be given as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters.

The domain definition must be interpreted as a subset of all the URI defined by the domain parameter of PXLOGICAL. The DOMAIN is used to select the physical instance of the logical proxy, and thus for example bearer and network access point. If no DOMAIN parameter is supplied for a physical proxy definition, the corresponding parameter value from the logical proxy definition is assumed to apply for the physical proxy as well.

PXADDR

The PXADDR can store addresses of different kinds, for example an IP address or a SME number. The type of address in the field is defined by the PXADDRTYPE parameter. This parameter MUST be supported by the WAP client.

PXADDRTYPE	Content of PXADDR
IPv4	An IPv4 address [RFC791] represented in decimal format with dots as delimiters
IPv6	An IPv6 address [RFC2373] represented as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters
E164	A phone number according to the E164 scheme [GENFORM]
ALPHA	Generic alphanumeric address (as defined by alphanum in [RFC2396])

PXADDRTYPE (0 or 1 entries)

The PXADDRTYPE indicates the format and the interpretation of the PXADDR attribute. The PXADDRTYPE can indicate an IP address, a phone number according to the E164 scheme, or a generic alphanumeric address format. If the parameter is not present or if no value is given, the default value IPv4 should be assumed. This parameter MUST be supported by the WAP client.

Value
IPv4 (default)
IPv6
E164
ALPHA

PXADDR-FQDN (0 or 1 entries)

The PXADDR-FQDN parameter can store a proxy address given as a fully qualified domain name. A PXADDR-FQDN MUST be a fully qualified Internet domain name (i.e. hostname as defined in section 3.2.2 of [RFC2396]).

WSP-VERSION (0 or 1 entries)

The WSP-VERSION indicates the WSP encoding version that the proxy in question supports. The format of this parameter is an integer representing the major version number followed by a “.” and an integer representing the minor version number. If no WSP-VERSION parameter is supplied for a physical proxy definition, the corresponding parameter value from the logical proxy definition is assumed to apply for the physical proxy as well.

PUSHENABLED (0 or 1 entries)

This parameter takes one of the values 0 or 1. If the value is 1 for a given physical proxy, this physical proxy will support push. The ME is consequently advised to enable push. If the value is 0 for a given physical proxy, this proxy will not support push. If no PUSHENABLED parameter is supplied for a physical proxy definition, the corresponding parameter value from the logical proxy definition is assumed to apply for the physical proxy as well. The parameter is advisory only and an ME might override the recommendation. In particular, it MUST be ignored if a SERVICE associated with the proxy always supports push.

PULLENABLED (0 or 1 entries)

This parameter takes one of the values 0 or 1. If the value is 1 for a given physical proxy, this physical proxy will support pull. If the value is 0 for a given physical proxy, this proxy will not support pull. If no PULLENABLED parameter is supplied for a physical proxy definition, the corresponding parameter value

from the logical proxy definition is assumed to apply for the physical proxy as well. The parameter is advisory only and an ME might override the recommendation. In particular, it MUST be ignored, if a SERVICE associated with the proxy always supports pull.

TO-NAPID (1 or more entries)

This parameter refers to a network access point with a matching NAPID parameter. It is only possible to refer to network access points defined within the same connectivity provisioning document (except if the INTERNET attribute is set in the NAPDEF). Several TO-NAPID parameters may be listed for a given physical proxy. The order of the list indicates the priority of the individual network access points. However, client preferences MAY also be considered which might affect the priority order (see also [PROVUAB]). One TO-NAPID has a special predefined meaning. If the TO-NAPID is INTERNET, it implies that the ME can select any network access point with the attribute INTERNET defined. This parameter MUST be supported by the WAP client.

4.6.3. Parameters for PXAUTHINFO characteristics

The PXAUTHINFO characteristic is only allowed to be used within a PXLOGICAL characteristic. Note that the parameters listed below are described in the scope of this particular characteristic.

PXAUTH-TYPE

The PXAUTH-TYPE indicates the proxy authentication method: HTTP proxy authentication or WTLS methods. Possible values are "HTTP-BASIC", "HTTP-DIGEST" and "WTLS-SS". This parameter does not indicate the actual authentication method to use when connecting to the proxy, but links the authentication parameters PXAUTH-ID and PXAUTH-PW to an authentication method. The PXAUTH-TYPE MUST be unique within its enclosed structure, i.e. within the PXLOGICAL characteristic.

PXAUTH-ID (0 or 1 entries)

The PXAUTH-ID indicates the proxy authentication identifier. If it is missing then the global id of the device should be used (see section 6.4). The global identifier can be defined for example using the ClientIdentity CLIENTIDENTITY characteristic.

PXAUTH-PW (0 or 1 entries)

The PXAUTH-PW indicates the proxy authentication secret. The usage of the parameter is defined by the PXAUTH-TYPE.

4.6.4. Parameters for PORT characteristics

The PORT characteristic is only allowed to be used within a PXLOGICAL, or a PXPHYSICAL, or APPADDR characteristics. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters

PORTNBR

The PORTNBR parameter contains the value of the port number. The port number must be given as a decimal number and must fit within the range of a 16 bit unsigned integer. The PORTNBR MUST be unique within its enclosed structure, i.e. within the PXLOGICAL, or the PXPHYSICAL, or APPADDR characteristic.

If the port number is well known [WAPWDP] [IANA], then the service behind the port is implied and the parameter SERVICE MAY be omitted [WAPWDP]. If the port number is not well known, then no service is implied and the service behind the port is defined in parameter SERVICE. If the port number is not well

known and the parameter SERVICE is omitted, then the ME MUST assume a service according to its preferences.

If the parameter SERVICE is present, then the definition in the SERVICE parameter overrides the implicit meaning.

This parameter MUST be supported by the WAP client.

SERVICE (0 or more entries)

The SERVICE parameter specifies which service is available behind this particular port number. Possible values are defined in the table below. The service can also be indicated by a well known port number being given as SERVICE. The format of this port number is as defined in PORTNBR. This parameter MUST be supported by the WAP client.

Service	Explanation
CL-WSP	WAP connection-less session service
CO-WSP	WAP session service
CL-SEC-WSP	WAP secure connection-less session service
CO-SEC-WSP	WAP secure session service
CO-SEC-WTA	WAP WTA secure session service (over WSP)
CL-SEC-WTA	WAP WTA secure connection-less session service (over WSP)
OTA-HTTP-TO	OTA-HTTP service (push), TO-TCP [PushOTA]
OTA-HTTP-TLS-TO	OTA-HTTP secure service (push), TO-TCP [PushOTA]
OTA-HTTP-PO	OTA-HTTP service (push), PO-TCP [PushOTA]
OTA-HTTP-TLS-PO	OTA-HTTP secure service (push), PO-TCP [PushOTA]

4.6.5. Parameters for NAPDEF characteristics

This section defines permitted parameters for the NAPDEF type of the characteristic, i.e. the names and parameters needed to access the backbone data network from the wireless terminal. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters

NAPID

The NAPID is used to link to the TO-NAPID parameter of the PXPHYSICAL characteristic. The NAPID MUST be unique within its enclosed structure, i.e. within the configuration context. This parameter MUST be supported by the WAP client.

BEARER (0 or more entries)

The BEARER indicates which network type (in addition to address type) the definition is valid for. This parameter MUST be supported by the WAP client.

Value
GSM-USSD
GSM-SMS
ANSI-136-GUTS
IS-95-CDMA-SMS
IS-95-CDMA-CSD
IS-95-CDMA-PACKET
ANSI-136-CSD

ANSI-136-GPRS
GSM-CSD
GSM-GPRS
AMPS-CDPD
PDC-CSD
PDC-PACKET
IDEN-SMS
IDEN-CSD
IDEN-PACKET
FLEX/REFLEX
PHS-SMS
PHS-CSD
TETRA-SDS
TETRA-PACKET
ANSI-136-GHOST
MOBITEX MPAK

NAME

The NAME indicates a logical, user readable, identity (property) of the configuration element. In the NAPDEF element it typically indicates the “owner” of the RAS, and if the element is to be used while in the home network or while roaming. This parameter MUST be supported by the WAP client.

INTERNET (0 or 1 entries)

This parameter does not take any values. If it is present, it indicates that the network access point can be used to access proxies that are located on an IP-routable network segment, which is generic within the scope of the configuration context. The existence of the parameter does not imply that the IP routable network that can be accessed is similar in scope to the world wide Internet.

NAP-ADDRESS

Contains all the digits and pauses needed to communicate with a remote entity and is defined in [GENFORM]. The format and the content of the parameter depend on the bearer type. The NAP-ADDRESS might contain for example

- The phone number of an access router
- A calling card dialling sequence
- A GPRS APN, which is an indirect address that has to be resolved by a network specific DNS mechanism.
- An address of an SMSC, or any other message centre

The NAP-ADDRESS should be in international format whenever possible, for example using the “+” notation as in GSM.

The type of address in the NAP-ADDRESS field is defined by the NAP-ADDRTYPE parameter. This parameter MUST be supported by the WAP client.

NAP-ADDRTYPE	Content of NAP-ADDRESS
IPv4	An IPv4 address [RFC791] represented in decimal format with dots as delimiters
IPv6	An IPv6 address [RFC2373] represented as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots

	and colons as delimiters
E164	A phone number according to the E164 scheme [GENFORM]
ALPHA	Generic alphanumeric address (as defined by alphanum in [RFC2396])
APN	A GPRS APN as defined in [GENFORM]
SCODE	A USSD service code as defined in [GENFORM]
TETRA-ITSI	A TETRA SDS address with digits in decimal format [WAPWDP]
MAN	A Mobitex MAN address with digits in decimal format [WAPWDP]

NAP-ADDRTYPE (0 or 1 entries)

The NAP-ADDRTYPE indicates the format of the address in the NAP-ADDRESS. This parameter MUST be supported by the WAP client.

Value
IPV4
IPV6
E164 (default)
ALPHA
APN
SCODE
TETRA-ITSI
MAN

CALLTYPE (0 or 1 entries)

Some bearers may support different types of calls or different protocols to be used for data exchange. The CALLTYPE parameter is used to define this protocol or call type. If the parameter is not present or if no value is given, the default value ANALOG-MODEM should be assumed.

Value
ANALOG-MODEM (default)
V.120
V.110
X.31
BIT-TRANSPARENT
DIRECT-ASYNCHRONOUS-DATA-SERVICE

LOCAL-ADDR (0 or 1 entries)

If this parameter is provided, it defines the local address of the WAP Client according to the format specified by the LOCAL-ADDRTYPE parameter.

The type of address in the LOCAL-ADDR field is defined by the LOCAL-ADDRTYPE parameter.

LOCAL-ADDRTYPE	Content of LOCAL-ADDR
IPV4	An IPv4 address [RFC791] represented in decimal format with dots as delimiters
IPV6	An IPv6 address [RFC2373] represented as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters

LOCAL-ADDRTYPE (0 or 1 entries)

The LOCAL-ADDRTYPE indicates the format of the address in the LOCAL-ADDR parameter. If the parameter is not present or if no value is given, the default value IPV6 should be assumed.

Value
IPV4
IPV6 (default)

DNS-ADDR (0 or more entries)

The DNS-ADDR can store the address of a DNS server. If the client implements [WDNS] this parameter MUST be supported. If this parameter is supported, at least two entries MUST be supported.

The address format SHALL conform to the following table. It is the responsibility of the client to distinguish between the two address types.

Address type	Format of DNS-ADDR
IPv4	An IPv4 address [RFC791] represented in decimal format with dots as delimiters
IPv6	An IPv6 address [RFC2373] represented as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters

LINKSPEED (0 or 1 entries)

Defines the speed on the up-link channel and optionally the down-link channel for circuit switched bearers. Possible values are "autobausing" or a number (baud in decimal format).

DNLINKSPEED (0 or 1 entries)

Defines the speed on the down-link channel for circuit switched bearers. Possible values are "autobausing" or a number (baud in decimal format). If this parameter is missing or if the ME does not support different up- and down-link speeds, the value of the LINKSPEED parameter may be assumed to be effective for the down-link channel as well.

LINGER (0 or 1 entries)

The LINGER parameter is used to define how long a connection should be kept active without any traffic. The parameter value is a decimal value expressed in seconds.

DELIVERY-ERR-SDU (0 or 1 entries)

The DELIVERY-ERR-SDU parameter indicates whether SDUs detected as erroneous shall be delivered or discarded. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

DELIVERY-ORDER (0 or 1 entries)

The DELIVERY-ORDER parameter indicates whether the PDP context bearer shall provide in-sequence SDU delivery or not. Values are defined in [3GPP24008] and are represented as hexadecimal numbers. Bits not part of the DELIVERY-ORDER parameter are set to zero, e.g. the value "with delivery order" is represented as 0x08.

TRAFFIC-CLASS (0 or 1 entries)

The TRAFFIC-CLASS defines the type of application for which the PDP context bearer service is optimised. For class descriptions see [3GPP23107] and values are defined in [3GPP24008]. The values are represented as hexadecimal numbers. Bits not part of the TRAFFIC-CLASS parameter are set to zero, e.g. the value "interactive class" is represented as 0x60.

MAX-SDU-SIZE (0 or 1 entries)

The MAX-SDU-SIZE parameter defines the maximum allowed SDU size and is used for admission control and policing. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

MAX-BITRATE-UPLINK (0 or 1 entries)

The MAX-BITRATE-UPLINK parameter defines the maximum number of bits delivered during a period of time in uplink. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

MAX-BITRATE-DNLINK (0 or 1 entries)

The MAX-BITRATE-DNLINK parameter defines the maximum number of bits delivered during a period of time in downlink. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

RESIDUAL-BER (0 or 1 entries)

The RESIDUAL-BER parameter indicates the undetected bit error ratio in the delivered SDUs. Values are defined in [3GPP24008] and are represented as hexadecimal numbers. Bits not part of the RESIDUAL-BER parameter are set to zero, e.g. the value "1*10⁻⁵" is represented as 0x70.

SDU-ERROR-RATIO (0 or 1 entries)

The SDU-ERROR-RATIO parameter indicates the fraction of SDUs lost or detected as erroneous and is defined only for conforming traffic. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

TRAFFIC-HANDL-PRIO (0 or 1 entries)

The TRAFFIC-HANDL-PRIO parameter specifies the relative importance for handling of all SDUs belonging to the PDP context bearer compared to the SDUs of other bearers. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

TRANSFER-DELAY (0 or 1 entries)

The TRANSFER-DELAY parameter indicates the maximum delay for 95th percentile of the distribution of delay for all delivered SDUs during the lifetime of a bearer service. Delay for an SDU is defined as the time from a request to transfer an SDU at one SAP to its delivery at the other SAP. Values are defined in [3GPP24008] and are represented as hexadecimal numbers. Bits not part of the TRANSFER-DELAY parameter are set to zero, e.g. the value "300 ms" is represented as 0x48.

GUARANTEED-BITRATE-UPLINK (0 or 1 entries)

The GUARANTEED-BITRATE-UPLINK parameter indicates the guaranteed number of bits delivered by the PDP context at a SAP within a period of time, divided by the duration of the period. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

GUARANTEED-BITRATE-DNLINK (0 or 1 entries)

The GUARANTEED-BITRATE-DNLINK parameter indicates the guaranteed number of bits delivered by the PDP context at a SAP within a period of time, divided by the duration of the period. Values are defined in [3GPP24008] and are represented as hexadecimal numbers.

4.6.6. Parameters for NAPAUTHINFO characteristics

The NAPAUTHINFO characteristic is only allowed to be used within a NAPDEF characteristic. Note that the parameters listed below are described in the scope of this particular characteristic.

AUTHTYPE

The AUTHTYPE is a parameter indicating the authentication protocol. Possible values are PAP and CHAP. This parameter does not indicate the actual authentication method to use when connecting to the network access point, but links the authentication parameters AUTHNAME and AUTHSECRET to the authentication method. The AUTHTYPE MUST be unique within its enclosed structure, i.e. within the NAPDEF characteristic.

AUTHNAME (0 or 1 entries)

The AUTHNAME parameter can contain the id (plaintext) needed to authenticate the user. This parameter is only needed if the AUTHTYPE parameter takes one of the values PAP or CHAP.

AUTHSECRET (0 or 1 entries)

The AUTHSECRET parameter can contain the password (plaintext) needed to authenticate the user. This parameter is only needed if the AUTHTYPE parameter takes one of the values PAP or CHAP.

4.6.7. Parameters for VALIDITY characteristics

The VALIDITY element is used to define country code and network code parameters, or system identity and system operator code parameters, as well as the period of time in which a certain NAPDEF is valid. If NETWORK is defined, then COUNTRY MUST be present. If SID is defined, then SOC MUST be present. The VALIDITY characteristic is only allowed to be used within the characteristic of type NAPDEF. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters**COUNTRY (0 or 1 entries)**

The COUNTRY indicates a Mobile Country Code as defined by ITU-T [E212]. The parameter is used to identify what resources to use when a mobile is in its home network or when the mobile is roaming. The COUNTRY MUST be unique within its enclosed structure, i.e. within the NAPDEF characteristic.

NETWORK (0 or 1 entries)

The NETWORK indicates a list of comma separated Mobile Network Codes in decimal format as defined by ITU-T [E212]. The parameter is used to identify what resources the mobile should use when it is registered to a particular network.

SID (0 or 1 entries)

The SID indicates a list of comma separated System IDs in decimal format as defined by [TIA/EIA-136-005A]. The parameter is used to identify what resources the mobile should use when it is registered to a particular network.

SOC (0 or 1 entries)

The SOC indicates a System Operator Code as defined by [TIA/EIA-136-005A]. The parameter is used to identify what resources the mobile should use when it is registered to a particular network. The SOC MUST be unique within its enclosed structure, i.e. within the NAPDEF characteristic.

VALIDUNTIL (0 or 1 entries)

Defines the end of the (time) period of validity. The parameter is expressed in seconds, from the time it is received by the client device.

4.6.8. Parameters for BOOTSTRAP characteristics

This section defines permitted parameters for the BOOTSTRAP characteristic. This characteristic is typically used within the bootstrap message. If NETWORK is defined, then COUNTRY MUST be present. Note that the parameters listed below are described in the scope of this particular characteristic.

If a provisioning document contains a PROVURL the PROVURL MUST be present only once in the provisioning document. The provisioning document may still contain multiple BOOTSTRAP characteristics but only one of them may contain a PROVURL. If the PROVURL is present in a BOOTSTRAP characteristic, NETWORK and COUNTRY MUST NOT be present in the same characteristic, since these are used to specify parameter settings for roaming purposes and the PROVURL is the unique identifier for the entire configuration context.

Names and values of parameters**NAME (0 or 1 entries)**

The NAME indicates a logical, user readable, identity (property) of the configuration context.

NETWORK (0 or more entries)

The NETWORK parameter MUST contain a decimal value that indicates for which network code (as defined in ITU-T [E212]) the bootstrap information is valid.

COUNTRY (0 or 1 entries)

The COUNTRY parameter defines the Mobile Country Codes as defined by ITU-T [E212]. The parameter is used to identify which country code the bootstrap information is valid.

PROXY-ID (0 or more entries)

The PROXY-ID parameter contains the ID of a proxy that is available with this particular set of bootstrap information. It is only possible to refer to proxies defined within the same connectivity provisioning document.

PROVURL (0 or 1 entries)

The PROVURL MUST be an absolute URI [RFC2396] and defines the authority and path of the TPS. The path of a request can be extended, and still be within the scope of the TPS, but it cannot be shortened. The URL to be used to contact the Trusted Provisioning Server, for example, for requests for re-provisioning (roaming). The PROVURL MUST be globally unique and is the unique identifier of the configuration context. If the scheme is missing from the PROVURL parameter, then "http" is assumed.

CONTEXT-ALLOW (0 or 1 entries)

The CONTEXT-ALLOW parameter defines how many additional configuration contexts the privileged context allows to the ME to support. If the parameter is present but no value is given, the default value 0 should be assumed. If the parameter is omitted it has no impact on the number of configuration contexts allowed. It may have the following values:

Value	Meaning
0	No other configuration context than the privileged context is allowed (default)
1...254	Describes how many ADDITIONAL configuration contexts beyond the privileged context are allowed. If the value exceeds the maximum number of supported contexts of the ME, the maximum number of supported contexts is used instead
255	Allows for the use of the maximum number of configuration contexts the ME supports

4.6.9. Parameters for CLIENTIDENTITY characteristics

The CLIENT-ID characteristic may be used to provide ME identity. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters

CLIENT-ID

The identifier of the mobile device, which for example could be the assigned-client-id as defined in [CLIENTID]. The parameter CLIENT-ID MUST NOT be defined more than once in a configuration context as it is global within the context.

4.6.10. Parameters for VENDORCONFIG characteristics

The VENDORCONFIG characteristics may be used to provide (ME) vendor specific configuration parameters. Note that the parameters listed below are described in the scope of this particular characteristic.

Names and values of parameters

NAME

The name of the product. The NAME MUST be unique within its enclosed structure, i.e. within the configuration context.

The actual configuration data is provided by means of vendor specific parameter names and values.

4.6.11. Parameters for APPLICATION characteristics

The APPLICATION characteristic provides parameters that a WAP client needs to access a particular application service access point. This may be, for example, a particular Multimedia Messaging Service Centre or some e-mail server. The APPLICATION characteristic is linked to proxy and network access point definitions that are appropriate in the case of this particular application service point. Note that the parameters listed below are described in the scope of this particular characteristic.

If this characteristic is supported the WAP client MUST support the parameters APPID, PROVIDER-ID and ADDR, as well as inclusion of APPADDR characteristics.

*Names and values of parameters***APPID**

The APPID identifies the type of the application service available at the described application service access point. The value is expected to be globally unique. The following name spaces may be used in identifying the application:

- X-WAP-Application-ID values registered with WINA [WINA]. This type of APPID is encoded as a string using the hexadecimal representation of the registered numeric X-WAP-Application-ID prefixed by the letter "w". For instance, you would indicate the Multimedia Messaging Service (<urn:x-wap-application:mms.ua>) with the value "w4". A WAP client MUST recognise this type of APPID.
- port number values registered with IANA [IANA]. This type of APPID is encoded as a string using the decimal representation of the registered port number. For instance, SMTP would be indicated with the value "25".
- absolute URI [RFC2396] values. This type of APPID could be used e.g. to identify a vendor-specific application with an HTTP URL pointing to a host in a domain controlled by the vendor.

PROVIDER-ID (0 or 1 entries)

The PROVIDER-ID parameter provides an identifier for the application service access point described by an APPLICATION characteristic. Two APPLICATION characteristics with the same APPID values but different PROVIDER-ID values MUST be considered to refer to two different application service access points. This parameter may also provide a globally unique external identification of the access point. If the parameter is omitted, the APPLICATION characteristic MUST be considered to describe an anonymous application service access point, which is not the same as the ones with an explicit PROVIDER-ID.

NAME (0 or 1 entries)

The NAME indicates a logical, user readable, identity (property) of the APPLICATION.

AACCEPT (0 or 1 entries)

The AACCEPT parameter lists the content types that the server is able to receive from the client. The value is a string containing a comma-separated list of content type specifiers. The values are in a preference order, with the content type most preferred by the server as the first entry. If this value is omitted, the supported values are discovered in some other manner.

A content type specifier is composed of a type indicator and an optional list of content type version numbers. The following kinds of type indicators are available:

- WSP content type codes maintained by WINA [WINA]. These type indicators are encoded as a string with the hexadecimal representation of the registered numeric content type code. A WAP client MUST recognise these values.
- MIME media type values [RFC2045].
- SGML public identifiers used in the DOCTYPE declaration of XML documents.

The list of content type version numbers is composed of values separated by semicolons ";". The values are in a preference order, with the version most preferred by the server as the first entry. The used version numbering scheme depends on the application, but use of '1*DIGIT ." 1*DIGIT' [RFC2234] is recommended.

APROTOCOL (0 or 1 entries)

The APROTOCOL indicates the application protocol versions supported by the server. The value is a string containing a comma-separated list of protocol identifiers. The values are in a preference order, with the protocol most preferred by the server as the first entry. If this value is omitted, the supported values are discovered in some other manner. The recognised protocol identifiers depend on the used application.

TO-PROXY (0 or more entries)

The TO-PROXY parameter refers either to a logical proxy with a matching PROXY-ID or a physical proxy with a matching PHYSICAL-PROXY-ID. Several TO-PROXY parameters may be listed for a given application. The order of the list indicates the priority of the individual network access points. However, client preferences MAY also be considered which might affect the priority order (see also [PROVUAB]).

This parameter MUST be supported by the WAP client, if it is able to use proxies.

TO-NAPID (0 or more entries)

The TO-NAPID parameter refers to a network access point with a matching NAPID parameter. It is only possible to refer to network access points defined within the same connectivity document (except if the INTERNET attribute is set in the NAPDEF). Several TO-NAPID parameters may be listed for a given application. The order of the list indicates the priority of the individual network access points. However, client preferences MAY also be considered which might affect the priority order (see also [PROVUAB]). One TO-NAPID has a special predefined meaning. If the TO-NAPID is INTERNET, it implies that the ME can select any network access point with the attribute INTERNET defined.

This parameter MUST be supported by the WAP client, if it is able communicate without a proxy.

ADDR (0 or more entries)

The ADDR parameter may be used to provide the address of the application server. The value can be an absolute URI [RFC2396], an IPv4 address [RFC791] represented in decimal format with dots as delimiters, or a fully qualified Internet domain name (i.e. *hostname* as defined in section 3.2.2 of [RFC2396]). The presence of this parameter is equivalent to including an APPADDR characteristic containing only the ADDR parameter with the same value.

4.6.12. Parameters for APPADDR characteristics

The APPADDR characteristic provides the address used to contact the application service access point. It is possible to have multiple alternate addresses for the same access point.

If this characteristic is supported, the WAP client MUST support the parameters ADDR and ADDRTYPE, as well as inclusion of PORT characteristics.

Names and values of parameters

ADDR

The ADDR parameter can hold addresses of different kinds, for example, an IP address or an SME number. The type of address in the field can be determined based on the ADDRTYPE parameter.

<u>Value of ADDRTYPE</u>	<u>Content of ADDR</u>
<u>Omitted</u>	Same types of values as may be used in the ADDR parameter of the APPLICATION characteristic.
<u>IPV6</u>	An IPv6 address [RFC2373] represented as hexadecimal numbers with colons as delimiters or as a combination of hexadecimal and decimal numbers with dots and colons as delimiters
<u>E164</u>	A phone number according to the E164 scheme [GENFORM]
<u>ALPHA</u>	Generic alphanumeric address (as defined by <i>alphanum</i> in [RFC2396])

ADDRTYPE (0 or 1 entries)

The ADDRTYPE indicates the format and interpretation of the ADDR parameter.

4.6.13. Parameters for APPAUTH characteristics

The APPAUTH characteristic provides authentication information to be used with the application service access point.

If this characteristic is supported, the WAP client MUST support the parameters AAUTHLEVEL, AAUTHTYPE, AAUTHNAME and AAUTHSECRET.

Names and values of parameters

AAUTHLEVEL (0 or 1 entries)

The AAUTHLEVEL parameter tells how the provided authentication credentials are to be applied.

Value	Meaning
<u>Omitted</u>	Authentication at the application protocol level, e.g. HTTP authentication.
<u>APPSRV</u>	Authentication done by the application service, e.g. by SyncML server.
<u>OBEX</u>	OBEX authentication

AAUTHTYPE (0 or 1 entries)

The AAUTHTYPE parameter indicates the authentication method used by the application. The value is a string containing a comma-separated list of authentication method identifiers. The values are in a preference order, with the method most preferred by the server as the first entry. The same credentials (AAUTHNAME and AAUTHSECRET) may be used with any of the listed authentication methods. If none of the listed methods are supported, the WAP client MUST NOT send the provided credentials to the server to avoid compromising them. If this parameter is omitted, the used method depends on the challenge sent by the server or is the default authentication mechanism defined by the application protocol.

Applications may choose to use their own authentication method identifiers, but the following ones are predefined:

Value	Meaning
<u>HTTP-BASIC</u>	Basic authentication done according to [RFC2617]
<u>HTTP-DIGEST</u>	Digest authentication done according to [RFC2617]
<u>BASIC</u>	The 'basic' authentication method recognised by the application
<u>DIGEST</u>	The 'digest' authentication method recognised by the application

AAUTHNAME (0 or 1 entries)

The AAUTHNAME parameter provides the id (plaintext) used in authenticating the user. The format and use of this parameter depend on AAUTHLEVEL and AAUTHTYPE.

AAUTHSECRET (0 or 1 entries)

The AAUTHSECRET provides the authentication secret used in authenticating the user. The format and use of this parameter depend on AAUTHLEVEL and AAUTHTYPE.

AAUTHDATA (0 or 1 entries)

The AAUTHDATA provides additional authentication parameters used in authenticating the user. The format and use of this parameter depend on AAUTHLEVEL and AAUTHTYPE.

4.6.14. Parameters for RESOURCE characteristics

The RESOURCE characteristic indicates the available resources and their access parameters within the APPLICATION characteristic. The resources could be, for example, synchronisable databases or mailboxes.

If this characteristic is supported, the WAP client MUST support the parameters URI and STARTPAGE. If any of AAUTHTYPE, AAUTHNAME and AAUTHSECRET is supported within this characteristic, all of them MUST be supported.

Names and values of parameters

URI

The URI parameter specifies the value used to identify the resource in the application protocol. It may be any string, but often is a relative or absolute URI [RFC2396].

NAME (0 or 1 entries)

The NAME indicates a user readable identity of the RESOURCE.

AACCEPT (0 or more entries)

The definition of this parameter is the same as for the APPLICATION characteristic except that it defines the content types that the server is able to accept when the client is accessing this particular RESOURCE.

AAUTHTYPE (0 or 1 entries)

The definition of this parameter is the same as for the AAUTHTYPE defined in the APPAUTH characteristic except that the authentication parameters are used only when the WAP client accesses the RESOURCE described by this characteristic.

AAUTHNAME (0 or 1 entries)

The AAUTHNAME parameter provides the id (plaintext) used in authenticating the user. The format and use of this parameter depend on AAUTHTYPE.

AAUTHSECRET (0 or 1 entries)

The AAUTHSECRET provides the authentication secret used in authenticating the user. The format and use of this parameter depend on AAUTHTYPE.

AAUTHDATA (0 or 1 entries)

The AAUTHDATA provides additional authentication parameters used in authenticating the user. The format and use of this parameter depend on AAUTHTYPE.

STARTPAGE (0 or 1 entries)

The presence of the STARTPAGE parameter indicates the resource to be one that the user agent is expected to access or select when it first starts accessing the application server. In particular, it may indicate the home page of a browser. This parameter does not take a value.

4.7. Connectivity Character Set

The provisioning document uses an XML language. It inherits the XML document character set and the rules for handling from XML [XML]. Provisioning documents MUST be encoded using UTF-8 [RFC2279]. Numeric character entities are supported, as well as the predefined entities amp, lt, gt, apos, quot that XML processors MUST

~~recognise. The connectivity content type MUST use the same character set rules as specified in [WML], except the rules for meta-information placed within the content, since such information is not supported in connectivity.~~

5. Well-formed Connectivity Provisioning Documents

5.1. The Length of Parameter Fields

The parameter length definitions in the table below express a minimum requirement on the Provisioning Agent and for every supported parameter the minimum length MUST be supported. The Provisioning Server can assume that parameters with a length shorter or equal to the definitions will be accepted (and stored) by the device.

Name	Length (byte)
<u>AACCEPT</u>	<u>16</u>
<u>AAUTHNAME</u>	<u>16</u>
<u>AAUTHSECRET</u>	<u>16</u>
<u>ADDR</u>	<u>64</u>
<u>APPID</u>	<u>16</u>
<u>APROTOCOL</u>	<u>16</u>
<u>AUTHNAME</u>	<u>16</u>
<u>AUTHSECRET</u>	<u>16</u>
<u>BASAUTH-ID</u>	<u>16</u>
<u>BASAUTH-PW</u>	<u>16</u>
<u>CLIENT-ID</u>	<u>32</u>
<u>DNLINKSPEED</u>	<u>6</u>
<u>DNS-ADDR</u>	<u>15 *)</u>
<u>DOMAIN</u>	<u>64</u>
<u>LINGER</u>	<u>4</u>
<u>LINKSPEED</u>	<u>6</u>
<u>NAME</u>	<u>16</u>
<u>NAP-ADDRESS</u>	<u>16 *) **)</u>
<u>NAPID</u>	<u>16</u>
<u>PHYSICAL-PROXY-ID</u>	<u>16</u>
<u>PROVIDER-ID</u>	<u>32</u>
<u>PROVURL</u>	<u>64</u>
<u>PROXY-ID</u>	<u>32 *)</u>
<u>PROXY-PROVIDER-ID</u>	<u>32 *)</u>
<u>PROXY-PW</u>	<u>16</u>
<u>PXADDR</u>	<u>40 *)</u>
<u>PXADDR-FQDN</u>	<u>64</u>
<u>PXAUTH-ID</u>	<u>16</u>
<u>PXAUTH-PW</u>	<u>16</u>
<u>STARTPAGE</u>	<u>64</u>
<u>URI</u>	<u>64</u>
<u>VALIDUNTIL</u>	<u>8</u>

*) If IPV6 is supported the minimum length requirement is 45 bytes.

**) The default dialstring is 16 bytes, but in networks where calling cards can be used the user agent has to support 64 bytes. Also GPRS terminals have to support 64 byte dialstrings.

5.2. The use of PORT characteristics

The total set of port bindings available for a given physical proxy is the port bindings defined for the logical proxy, appended with the port bindings given within the PXPHYSICAL characteristic. If the resulting set of port bindings is empty, then the ME MUST assume a port and service according to its preferences. Each port can support multiple services. If more than one service is supported then all services must be explicitly defined. A ME implementation MUST reject new port bindings if any inconsistencies occur between the port bindings in the root of the PXLOGICAL or in the root of the PXPHYSICAL characteristics.

5.3. Missing VALIDITY characteristics

If a VALIDITY characteristic is absent inside a NAPDEF characteristic, the NAP definition is always valid.

5.4. The use of PXAUTHINFO and CLIENTIDENTITY characteristics

The use of the parameters PXAUTH-ID and CLIENT-ID is defined by the following set of rules, which MUST be used if the parameters are supported:

1. Use parameter PXAUTH-ID if it is present and a value is given
2. Expect user input if parameter PXAUTH-ID is present but no value is given (empty string)
3. If parameter PXAUTH-ID is not present, use parameter CLIENT-ID if it is present and a value is given
4. If parameter PXAUTH-ID is not present and parameter CLIENT-ID is present but no value is given (empty string) then use a possible built-in device identity. The use of the built-in device identity MAY be prohibited depending on the client's own privacy policies.
5. If parameters PXAUTH-ID and CLIENT-ID are not present, then user input is expected

If the parameter PXAUTH-PW is missing despite indications from PXAUTH-TYPE that it should be used, then user input is expected.

5.5. Missing AUTHTYPE parameters

If either AUTHNAME or AUTHSECRET are missing despite indications from AUTHTYPE that they should be used, the user MUST be prompted for input for the missing AUTHNAME, AUTHSECRET or both. If AUTHNAME or AUTHSECRET are supposed to be empty strings, it must be explicitly declared by inserting the appropriate AUTHNAME or AUTHSECRET with the value of an empty string into the provisioning document.

6. Examples and discussion

This section is informative only.

6.1. Example 1

This example shows a connectivityprovisioning document containing infrastructure information related to a single logical and physical WSP proxy for a service domain with a single access point.

```
<?xml version="1.0"?>
<!DOCTYPE wap-provisioningdoc PUBLIC "-//WAPFORUM//DTD PROV 1.0//EN"
"http://www.wapforum.org/DTD/prov.dtd">

<wap-provisioningdoc version="1.0">

<characteristic type="PXLOGICAL">
  <parm name="PROXY-ID" value="170.187.51.4"/>
  <parm name="NAME" value="BankMainProxy"/>
  <parm name="STARTPAGE" value="http://www.bank.com/startpage.wml"/>
<characteristic type="PXAUTHINFO">
  <parm name="PXAUTH-TYPE" value="HTTP--BASIC"/>
  <parm name="PXAUTH-ID" value="pxusername"/>
  <parm name="PXAUTH-PW" value="pxuserpassw"/>
</characteristic>
<characteristic type="PXPHYSICAL">
  <parm name="PHYSICAL-PROXY-ID" value="PROXY 1"/>
  <parm name="DOMAIN" value="www.bank.com//"/>
  <parm name="PXADDR" value="170.187.51.3"/>
  <parm name="PXADDRTYPE" value="IPV4"/>
  <parm name="TO-NAPID" value="INTERNET"/>
  <parm name="TO-NAPID" value="NAP1"/>
  <characteristic type="PORT">
    <parm name="PORTNBR" value="9203"/>
  </characteristic>
</characteristic>
</characteristic>

<characteristic type="NAPDEF">
  <parm name="NAPID" value="NAP1"/>
  <parm name="BEARER" value="GSM-CSD"/>
  <parm name="NAME" value="MY ISP CSD"/>
  <parm name="NAP-ADDRESS" value="+35808124002"/>
  <parm name="NAP-ADDRTYPE" value="E164"/>
  <parm name="CALLTYPE" value="ANALOG--MODEM"/>
<characteristic type="NAPAUTHINFO">
  <parm name="AUTHTYPE" value="PAP"/>
  <parm name="AUTHNAME" value="wwwmmuser"/>
  <parm name="AUTHSECRET" value="wwwmmsecret"/>
</characteristic>
<characteristic type="VALIDITY">
  <parm name="COUNTRY" value="228"/>
  <parm name="NETWORK" value="001"/>
</characteristic>
</characteristic>

</wap-provisioningdoc>
```

6.2. Example 2

Infrastructure information with two bearers and thus two network access points.

```

<?xml version="1.0"?>
<!DOCTYPE wap-provisioningdoc PUBLIC "-//WAPFORUM//DTD PROV 1.0//EN"
"http://www.wapforum.org/DTD/prov.dtd">

<wap-provisioningdoc version="1.1">

<characteristic type="PXLOGICAL">
  <parm name="PROXY-ID" value="170.187.51.4"/>
  <parm name="NAME" value="DefaultProxy"/>
  <parm name="STARTPAGE" value="http://www.operator.com/start.wml"/>
  <characteristic type="PXAUTHINFO">
    <parm name="PXAUTH-TYPE" value="HTTP--BASIC"/>
    <parm name="PXAUTH-ID" value="pxusername"/>
    <parm name="PXAUTH-PW" value="pxuserpassw"/>
  </characteristic>
  <characteristic type="PXPHYSICAL">
    <parm name="PHYSICAL-PROXY-ID" value="PROXY 1"/>
    <parm name="DOMAIN" value=" "/>
    <parm name="PXADDR" value="221.125.51.4"/>
    <parm name="PXADDRTYPE" value="IPV4"/>
    <parm name="PXADDR-FQDN" value="proxy1.operator.com"/>
    <parm name="TO-NAPID" value="NAP1"/>
    <characteristic type="PORT">
      <parm name="PORTNBR" value="9203"/>
    </characteristic>
  </characteristic>
  <characteristic type="PXPHYSICAL">
    <parm name="PHYSICAL-PROXY-ID" value="PROXY 2"/>
    <parm name="DOMAIN" value="/SMSContent/"/>
    <parm name="DOMAIN" value="sms.operator.com"/>
    <parm name="PXADDR" value="9400410"/>
    <parm name="PXADDRTYPE" value="E164"/>
    <parm name="TO-NAPID" value="NAP2"/>
    <characteristic type="PORT">
      <parm name="PORTNBR" value="9201"/>
    </characteristic>
  </characteristic>
</characteristic>

<characteristic type="NAPDEF">
  <parm name="NAPID" value="NAP1"/>
  <parm name="BEARER" value="GSM-/CSD"/>
  <parm name="NAME" value="ANY NAME 1"/>
  <parm name="NAP-ADDRESS" value="+4520671023"/>
  <parm name="NAP-ADDRTYPE" value="E164"/>
  <parm name="CALLTYPE" value="ANALOG--MODEM"/>
  <parm name="LINKSPEED" value="AUTOBauding"/>
  <characteristic type="NAPAUTHINFO">
    <parm name="AUTHTYPE" value="PAP"/>
    <parm name="AUTHNAME" value="roamwapuser"/>
    <parm name="AUTHSECRET" value="roamwappassw"/>
  </characteristic>
</characteristic>
```

```

</characteristic>
<characteristic type="VALIDITY">
  <parm name="COUNTRY" value="228"/>
</characteristic>
</characteristic>

<characteristic type="NAPDEF">
  <parm name="NAPID" value="NAP2"/>
  <parm name="BEARER" value="GSM-SMS"/>
  <parm name="NAME" value="ANY NAME 2"/>
  <parm name="NAP-ADDRESS" value="+35809503401"/>
  <parm name="NAP-ADDRTYPE" value="E164"/>
</characteristic>

</wap-provisioningdoc>

```

In the above example, bearer selection policies for GSM-/CSD and GSM-/SMS are shown.

The document provides information on how to access the default gateway via two NAP's. Note that complete information on NAP's as well as the physical proxies is given since it is not known in advance how much knowledge the ME has about the infrastructure.

6.3. Example 3

Infrastructure information related to several logical WSP proxies for a service domain with multiple access points. Vendor specific configuration data is also supplied. This situation is typically encountered when fetching connectivityprovisioning documents from a SIM card [PROVSC].

```

<?xml version="1.0"?>
<!DOCTYPE wap-provisioningdoc PUBLIC "-//WAPFORUM//DTD PROV 1.0//EN"
"http://www.wapforum.org/DTD/prov.dtd">

    <parm name="NAP-ADDRTYPE" value="APN"/>
  </characteristic>

  <characteristic type="BOOTSTRAP">
    <parm name="CONTEXT-ALLOW" value="0"/>
    <parm name="PROVURL" value="http://www.operator.com/TPS//"/>
  </characteristic>

</wap-provisioningdoc>

```

7. WBXML Encoding

For an example of a WBXML encoded provisioning document see appendix D.

7.1. Element tokens

The following token codes represent tags in code page zero (0). All numbers are in hexadecimal.

<i>Tag Name</i>	<i>Token</i>
wap-provisioningdoc	5
characteristic	6
parm	7

The following token codes represent tags in code page one (1). All numbers are in hexadecimal.

<i>Tag Name</i>	<i>Token</i>
characteristic	6
parm	7

7.2. Attribute Start Tokens

The following token codes represent the start of an attribute in code page zero (0) unless stated otherwise. All numbers are in hexadecimal.

7.2.1. Wap-provisioningdoc Attribute Start Tokens

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
version		45
version	1.0	46

7.2.2. Characteristic Attribute Start Tokens

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
type		50
type	PXLOGICAL	51
type	PXPYHICAL	52
type	PORT	53

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
type	VALIDITY	54
type	NAPDEF	55
type	BOOTSTRAP	56
type	VENDORCONFIG	57
type	CLIENTIDENTITY	58
type	PXAUTHINFO	59
type	NAPAUTHINFO	5A

The token codes in the following table represent tags in code page one (1). All numbers are in hexadecimal.

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
type		50
type	PORT	53
type	CLIENTIDENTITY	58
type	APPLICATION	55
type	APPADDR	56
type	APPAUTH	57
type	RESOURCE	59

7.2.3. Parm Attribute Start Tokens

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
name		5
value		6
name	NAME	7
name	NAP-ADDRESS	8
name	NAP-ADDRTYPE	9
name	CALLTYPE	A
name	VALIDUNTIL	B
name	AUTHTYPE	C
name	AUTHNAME	D

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
name	AUTHSECRET	E
name	LINGER	F
name	BEARER	10
name	NAPID	11
name	COUNTRY	12
name	NETWORK	13
name	INTERNET	14
name	PROXY-ID	15
name	PROXY-PROVIDER-ID	16
name	DOMAIN	17
name	PROVURL	18
name	PXAUTH-TYPE	19
name	PXAUTH-ID	1A
name	PXAUTH-PW	1B
name	STARTPAGE	1C
name	BASAUTH-ID	1D
name	BASAUTH-PW	1E
name	PUSHENABLED	1F
name	PXADDR	20
name	PXADDRTYPE	21
name	TO-NAPID	22
name	PORTNBR	23
name	SERVICE	24
name	LINKSPEED	25
name	DNLINKSPEED	26
name	LOCAL-ADDR	27
name	LOCAL-ADDRTYPE	28
name	CONTEXT-ALLOW	29
name	TRUST	2A
name	MASTER	2B

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
name	SID	2C
name	SOC	2D
name	WSP-VERSION	2E
name	PHYSICAL-PROXY-ID	2F
name	CLIENT-ID	30
name	DELIVERY-ERR-SDU	31
name	DELIVERY-ORDER	32
name	TRAFFIC-CLASS	33
name	MAX-SDU-SIZE	34
name	MAX-BITRATE-UPLINK	35
name	MAX-BITRATE-DNLINK	36
name	RESIDUAL-BER	37
name	SDU-ERROR-RATIO	38
name	TRAFFIC-HANDL-PRIOR	39
name	TRANSFER-DELAY	3A
name	GUARANTEED-BITRATE-UPLINK	3B
name	GUARANTEED-BITRATE-DNLINK	3C
<u>name</u>	<u>PXADDR-FQDN</u>	<u>3D</u>
<u>name</u>	<u>PROXY-PW</u>	<u>3E</u>
<u>name</u>	<u>PPGAUTH-TYPE</u>	<u>3F</u>
<u>name</u>	<u>PULLENABLED</u>	<u>47</u>
<u>name</u>	<u>DNS-ADDR</u>	<u>48</u>

The token codes in the following table represent tags in code page one (1). All numbers are in hexadecimal.

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
<u>name</u>		<u>5</u>
<u>value</u>		<u>6</u>
<u>name</u>	<u>NAME</u>	<u>7</u>
<u>name</u>	<u>INTERNET</u>	<u>14</u>

<i>Attribute Name</i>	<i>Attribute Value Prefix</i>	<i>Token</i>
<u>name</u>	<u>STARTPAGE</u>	<u>1C</u>
<u>name</u>	<u>TO-NAPID</u>	<u>22</u>
<u>name</u>	<u>PORTNBR</u>	<u>23</u>
<u>name</u>	<u>SERVICE</u>	<u>24</u>
<u>name</u>	<u>AACCEPT</u>	<u>2E</u>
<u>name</u>	<u>AAUTHDATA</u>	<u>2F</u>
<u>name</u>	<u>AAUTHLEVEL</u>	<u>30</u>
<u>name</u>	<u>AAUTHNAME</u>	<u>31</u>
<u>name</u>	<u>AAUTHSECRET</u>	<u>32</u>
<u>name</u>	<u>AAUHTTYPE</u>	<u>33</u>
<u>name</u>	<u>ADDR</u>	<u>34</u>
<u>name</u>	<u>ADDRTYPE</u>	<u>35</u>
<u>name</u>	<u>APPID</u>	<u>36</u>
<u>name</u>	<u>APROTOCOL</u>	<u>37</u>
<u>name</u>	<u>PROVIDER-ID</u>	<u>38</u>
<u>name</u>	<u>TO-PROXY</u>	<u>39</u>
<u>name</u>	<u>URI</u>	<u>3A</u>

7.3. Parameter Token Values

Here, values of parameters, and their tokenization, are defined within each parameter description. The token table is logically divided in different subsections, however the token values are for global use within the attribute Value of the PARM element.

The following token codes represent attribute values in code page zero (0). All numbers are in hexadecimal.

7.3.1. ADDRTYPE Value

<i>Attribute Value</i>	<i>Token</i>
IPV4	85
IPV6	86
E164	87
ALPHA	88
APN	89

<i>Attribute Value</i>	<i>Token</i>
SCODE	8A
TETRA-ITSI	8B
MAN	8C

The token codes in the following table represent tags in code page one (1). All numbers are in hexadecimal.

<i>Attribute Value</i>	<i>Token</i>
<u>IPV6</u>	<u>86</u>
<u>E164</u>	<u>87</u>
<u>ALPHA</u>	<u>88</u>
<u>APPSRV</u>	<u>8D</u>
<u>OBEX</u>	<u>8E</u>

7.3.2. CALLTYPE Value

<i>Attribute Value</i>	<i>Token</i>
ANALOG-MODEM	90
V.120	91
V.110	92
X.31	93
BIT-TRANSPARENT	94
DIRECT-ASYNCHRONOUS-DATA-SERVICE	95

7.3.3. AUTHTYPE/PXAUTH-TYPE Value

<i>Attribute Value</i>	<i>Token</i>
PAP	9A
CHAP	9B
HTTP-BASIC	9C
HTTP-DIGEST	9D
WTLS-SS	9E

7.3.4. BEARER Value

<i>Attribute Value</i>	<i>Token</i>
GSM-USSD	A2
GSM-SMS	A3
ANSI-136-GUTS	A4
IS-95-CDMA-SMS	A5
IS-95-CDMA-CSD	A6
IS-95-CDMA-PACKET	A7
ANSI-136-CSD	A8
ANSI-136-GPRS	A9
GSM-CSD	AA
GSM-GPRS	AB
AMPS-CDPD	AC
PDC-CSD	AD
PDC-PACKET	AE
IDEN-SMS	AF
IDEN-CSD	B0
IDEN-PACKET	B1
FLEX/REFLEX	B2
PHS-SMS	B3
PHS-CSD	B4
TETRA-SDS	B5
TETRA-PACKET	B6
ANSI-136-GHOST	B7
MOBITEX-MPAK	B8

7.3.5. LINKSPEED Value

<i>Attribute Value</i>	<i>Token</i>
AUTOBAUDING	C5

7.3.6. SERVICE Value

<i>Attribute Value</i>	<i>Token</i>
CL-WSP	CA
CO-WSP	CB
CL-SEC-WSP	CC
CO-SEC-WSP	CD
CL-SEC-WTA	CE
CO-SEC-WTA	CF
<u>OTA-HTTP-TO</u>	<u>D0</u>
<u>OTA-HTTP-TLS-TO</u>	<u>D1</u>
<u>OTA-HTTP-PO</u>	<u>D2</u>
<u>OTA-HTTP-TLS-PO</u>	<u>D3</u>

7.3.7. AAUTHTYPE Value

The token codes in the following table represent tags in code page one (1). All numbers are in hexadecimal.

<i>Attribute Value</i>	<i>Token</i>
<u>,</u> (comma character)	<u>80</u>
<u>HTTP-</u>	<u>81</u>
<u>BASIC</u>	<u>82</u>
<u>DIGEST</u>	<u>83</u>

Appendix A. Static Conformance Requirements (Normative)

The notation used in this appendix is specified in [CREQ].

A.1. Client Features

A.1.1. Character Set and Encoding

Item	Function	Ref.	Status	Requirement
ProvCont-CSE-C-001	UTF-8 Encoding.	4.7, [W ML]	O <u>M</u>	
ProvCont-CSE-C-002	UTF-16 Encoding.	4.7, [W ML]	O	
ProvCont-CSE-C-003	UCS-4 Encoding.	4.7, [W ML]	O	
ProvCont-CSE-C-004	Other character encoding.	4.7, [W ML]	O	
ProvCont-CSE-C-005	Reference processing (no meta-information).	4.7, [W ML]	M	
ProvCont-CSE-C-006	Character entities.	4.7, [W ML]	M	

A.1.2. Content Format and Tokenization

Item	Function	Ref.	Status	Requirement
ProvCont-CO-C-001	Support for the WAP-PROVISIONINGDOC-DTD.	4.1	M	
ProvCont-CO-C-002	Support for WAP-PROVISIONINGDOC in textual form (text/vnd.wap.connectivity-xml).	4.2	O	
ProvCont-CO-C-003	Support for WAP-PROVISIONINGDOC in tokenized form (application/vnd.wap.connectivity-wbxml).	7	M	WBXML-C-001 AND WBXML-C-011
ProvCont-CO-C-004	Support for media type parameter MAC	4.3	M	
ProvCont-CO-C-005	Support for media type parameter SEC	4.3	M	

A.1.3. Elements and attributes

Item	Function	Ref.	Status	Requirement
ProvCont-CEA-C-001	Support for the element wap-provisioningdoc	4.4	M	
ProvCont-CEA-C-002	Support for the element characteristic	4.5	M	
ProvCont-CEA-C-003	Support for the element parm	4.6	M	
ProvCont-CEA-C-004	Support for the wap-provisioningdoc attribute "version"	4.4	M	
ProvCont-CEA-C-005	Support for the characteristic attribute "type"	4.5	M	
ProvCont-CEA-C-006	Support for the parm attribute "name"	4.6	M	

Item	Function	Ref.	Status	Requirement
ProvCont-CEA-C-007	Support for the parm attribute "value"	4.6	M	

A.1.4. Characteristics

Item	Function	Ref.	Status	Requirement
ProvCont-CC-C-001	Support for the characteristic PXLOGICAL	4.5.1	M	
ProvCont-CC-C-002	Support for the characteristic PXPHYSICAL	4.5.2	M	
ProvCont-CC-C-003	Support for the characteristic PXAUTHINFO	4.5.3	O	ProvCont-CPA-C-001 AND ProvCont-CPA-C-002
ProvCont-CC-C-004	Support for the characteristic NAPDEF	4.5.5	M	
ProvCont-CC-C-005	Support for the characteristic NAPAUTHINFO	4.5.6	O	ProvCont-CNA-C-001 AND ProvCont-CNA-C-002 AND ProvCont-CNA-C-003
ProvCont-CC-C-006	Support for the characteristic PORT	4.5.4, 5.2	M	
ProvCont-CC-C-007	Support for the characteristic VALIDITY	4.5.7	O	ProvCont-CV-C-005 AND (ProvCont-CV-C-001 AND ProvCont-CV-C-002) OR (ProvCont-CV-C-003 AND ProvCont-CV-C-004)
ProvCont-CC-C-008	Support for the characteristic BOOTSTRAP	4.5.8	O	ProvCont-CB-C-002
ProvCont-CC-C-009	Support for the characteristic CLIENTIDENTITY	4.5.9	O	ProvCont-CID-C-001
ProvCont-CC-C-010	Support for the characteristic VENDORCONFIG	4.5.10	O	ProvCont-CVC-C-001
ProvCont-CC-C-011	<u>Support for the characteristic APPLICATION</u>	4.5.11	O	<u>ProvCont-CAP-C-001 AND ProvCont-CC-C-012</u>
ProvCont-CC-C-012	<u>Support for the characteristic APPADDR</u>	4.5.12	O	<u>ProvCont-CAA-C-001</u>
ProvCont-CC-C-013	<u>Support for the characteristic APPAUTH</u>	4.5.13	O	<u>ProvCont-CAU-C-001</u>
ProvCont-CC-C-014	<u>Support for the characteristic RESOURCE</u>	4.5.14	O	<u>ProvCont-CRE-C-001</u>

A.1.5. Characteristic PXLOGICAL

Item	Function	Ref.	Status	Requirement
ProvCont-CPL-C-001	Support for the parm PROXY-ID	4.6.1	M	ProvCont-MLP-C-005
ProvCont-CPL-C-002	Support for the parm PROXY-PROVIDER-ID	4.6.1	O	ProvCont-MLP-C-021
ProvCont-CPL-C-003	Support for the parm NAME	4.6.1	M	ProvCont-MLP-C-001
ProvCont-CPL-C-004	Support for the parm DOMAIN	4.6.1	M	ProvCont-MLP-C-006
ProvCont-CPL-C-005	Support for the parm TRUST	4.6.1	O	
ProvCont-CPL-C-006	Support for the parm MASTER	4.6.1	O	

Item	Function	Ref.	Status	Requirement
ProvCont-CPL-C-007	Support for the parm STARTPAGE	4.6.1	M	ProvCont-MLP-C-010
ProvCont-CPL-C-008	Support for the parm BASAUTH-ID	4.6.1	M	ProvCont-MLP-C-011
ProvCont-CPL-C-009	Support for the parm BASAUTH-PW	4.6.1	M	ProvCont-MLP-C-012
ProvCont-CPL-C-010	Support for the parm WSP-VERSION	4.6.1	O	
ProvCont-CPL-C-011	Support for the parm PUSHENABLED	4.6.1	O	
ProvCont-CPL-C-012	Support for PORT characteristic within PXLOGICAL	4.5.4	M	
ProvCont-CPL-C-013	Support for multiple PORT characteristics within PXLOGICAL	4.5.4	O	
ProvCont-CPL-C-014	Support for the parm PROXY-PW	4.6.1	O	ProvCont-MLP-C-023
ProvCont-CPL-C-015	Support for the parm PPGAUTH-TYPE	4.6.1	O	
ProvCont-CPL-C-016	Support for the parm PULLENABLED	4.6.1	O	

A.1.6. Characteristic PXPHYSICAL

Item	Function	Ref.	Status	Requirement
ProvCont-CPP-C-001	Support for the parm PHYSICAL-PROXY-ID	4.6.2	M	ProvCont-MLP-C-018
ProvCont-CPP-C-002	Support for the parm PXADDR	4.6.2	M	ProvCont-MLP-C-013

ProvCont-CPP-C-004	Support for the parm TO-NAPID	4.6.2	M	
ProvCont-CPP-C-005	Support for the parm DOMAIN	4.6.2	O	ProvCont-MLP-C-006
ProvCont-CPP-C-006	Support for the parm WSP-VERSION	4.6.2	O	
ProvCont-CPP-C-007	Support for the parm PUSHENABLED	4.6.2	O	
ProvCont-CPP-C-008	Support for the TO-NAPID value "INTERNET"	4.6.2	O	
ProvCont-CPP-C-009	Support for PXADDRTYPE value "IPV4"	4.6.2	O	
ProvCont-CPP-C-010	Support for PXADDRTYPE value "IPV6"	4.6.2	O	
ProvCont-CPP-C-011	Support for PXADDRTYPE value "E164"	4.6.2	O	
ProvCont-CPP-C-012	Support for PXADDRTYPE value "ALPHA"	4.6.2	O	
ProvCont-CPP-C-013	Support for PORT characteristic within PXPHYSICAL	4.5.4	M	
ProvCont-CPP-C-014	Support for multiple PORT characteristics within PXPHYSICAL	4.5.4	O	
ProvCont-CPP-C-015	Support for multiple TO-NAPID within one PXPHYSICAL	4.6.2	O	
ProvCont-CPP-C-016	Support for the parm PXADDR-FQDN	4.6.2	O	ProvCont-MLP-C-022
ProvCont-CPP-C-017	Support for the parm PULLENABLED	4.6.2	O	

A.1.7. Characteristic PXAUTHINFO

Item	Function	Ref.	Status	Requirement
ProvCont-CPA-C-001	Support for the parm PXAUTH-TYPE	4.6.3	O	ProvCont-CPA-C-004 OR

Item	Function	Ref.	Status	Requirement
				ProvCont-CPA-C-005 OR ProvCont-CPA-C-006
ProvCont-CPA-C-002	Support for the parm PXAUTH-ID	4.6.3	O	ProvCont-CPA-C-007 OR ProvUAB-UDP-C-006 AND ProvCont-MLP-C-008
ProvCont-CPA-C-003	Support for the parm PXAUTH-PW	4.6.3	O	ProvCont-MLP-C-009
ProvCont-CPA-C-004	Support for PXAUTH-TYPE value "HTTP-BASIC"	4.6.3	O	ProvCont-CPA-C-003
ProvCont-CPA-C-005	Support for PXAUTH-TYPE value "HTTP-DIGEST"	4.6.3	O	ProvCont-CPA-C-003
ProvCont-CPA-C-006	Support for PXAUTH-TYPE value "WTLS-SS"	4.6.3	O	
ProvCont-CPA-C-007	Usage of parm PXAUTH-ID	5.4	O	

A.1.8. Characteristic PORT

Item	Function	Ref.	Status	Requirement
ProvCont-CP-C-001	Support for the parm PORTNBR	4.6.4	M	
ProvCont-CP-C-002	Support for the parm SERVICE	4.6.4	M	ProvCont-CP-C-003 OR ProvCont-CP-C-004 OR ProvCont-CP-C-005 OR ProvCont-CP-C-006 OR ProvCont-CP-C-007 OR ProvCont-CP-C-008 OR ProvCont-CP-C-009 OR ProvCont-CP-C-010 OR ProvCont-CP-C-011 OR ProvCont-CP-C-012
ProvCont-CP-C-003	Support for SERVICE value "CL-WSP"	4.6.4	O	
ProvCont-CP-C-004	Support for SERVICE value "CO-WSP"	4.6.4	O	
ProvCont-CP-C-005	Support for SERVICE value "CL-SEC-WSP"	4.6.4	O	
ProvCont-CP-C-006	Support for SERVICE value "CO-SEC-WSP"	4.6.4	O	
ProvCont-CP-C-007	Support for SERVICE value "CO-SEC-WTA"	4.6.4	O	
ProvCont-CP-C-008	Support for SERVICE value "CL-SEC-WTA"	4.6.4	O	
ProvCont-CP-C-009	Support for SERVICE value "OTA-HTTP-TO"	4.6.4	O	ProvCont-CPL-C-014 AND ProvCont-CPL-C-015
ProvCont-CP-C-010	Support for SERVICE value "OTA-HTTP-TLS-TO"	4.6.4	O	ProvCont-CPL-C-014 AND ProvCont-CPL-C-015
ProvCont-CP-C-011	Support for SERVICE value "OTA-HTTP-PO"	4.6.4	O	ProvCont-CPL-C-014 AND ProvCont-CPL-C-015
ProvCont-CP-C-012	Support for SERVICE value "OTA-HTTP-TLS-PO"	4.6.4	O	ProvCont-CPL-C-014 AND ProvCont-CPL-C-015

A.1.9. Characteristic NAPDEF

Item	Function	Ref.	Status	Requirement
ProvCont-CND-C-001	Support for the parm NAPID	4.6.5	M	ProvCont-MLP-C-019
ProvCont-CND-C-002	Support for the parm BEARER	4.6.5	M	ProvCont-CBS-C-001 OR ProvCont-CBS-C-002 OR ProvCont-CBS-C-003 OR ProvCont-CBS-C-004 OR ProvCont-CBS-C-005 OR ProvCont-CBS-C-006 OR ProvCont-CBS-C-007 OR ProvCont-CBS-C-008 OR ProvCont-CBS-C-009 OR ProvCont-CBS-C-010 OR ProvCont-CBS-C-011 OR ProvCont-CBS-C-012 OR ProvCont-CBS-C-013 OR ProvCont-CBS-C-014 OR ProvCont-CBS-C-015 OR ProvCont-CBS-C-016 OR ProvCont-CBS-C-017 OR ProvCont-CBS-C-018 OR ProvCont-CBS-C-019 OR ProvCont-CBS-C-020 OR ProvCont-CBS-C-021 OR ProvCont-CBS-C-022 OR ProvCont-CBS-C-023

Appendix B. Change History (Informative)

Type of Change	Date	Section	Description
Class 0	14-Mar-2001		The initial version of this document.
Class 2	24-Jul-2001		Included SINs WAP-183_001-ProvCont-20010614-a and WAP-183_002-ProvCont-20010716-a.
Class 3	25-Feb-2002	All	New template.
Class 0	-Aug-2002- Aug-2002-15- Aug-2002	Several	Updated for 2.0 compliance. Incorporated SINs WAP-183_003-ProvCont-20010912-a WAP-183_004-ProvCont-20011025-a WAP-183_005-ProvCont-20020411-a.

Appendix C. Provisioning Registration (Informative)

WINA [WINA] provides a possibility to register information on how provisioning parameters are used by a specific application protocol or application service type in order to improve interoperability. This appendix describes the format and contents of the document that WINA expects to receive when the registration is done.

The use of the provisioning parameters should be documented in such detail that support for the application service type can be implemented in a provisioning server based only on the registration information. In particular, intimate knowledge of the application specifications or the workings of some specific user agent implementation should not be required. If some parameter is not documented in the WINA registration, it may still be used, but interoperability is not as likely.

C.1. General Format

The registration information must be provided in a text file written in English. The name of the file must end with '.txt'. The beginning of the file name should be equal to the APPID value used for the application type. If the APPID is a URI, some appropriate name that is not likely to collide with other registration information file names must be selected. WINA reserves the right to rename the registration information file as it sees fit.

The registration information file must contain the following sections:

- Identifying information
- Well-known parameters
- Application-specific parameters
- Parameter values
- Example

Each section starts with its name written in uppercase followed by a line containing hash mark '#' characters. If some section would have no content, this is indicated with the text 'N/A' (not applicable).

Each section is composed of information items. The name of each information item is at the beginning of a line and is terminated with a colon ':'. If the item description fits on a single line, it must be on the same line as the item name. Otherwise it must start on a new line and each line in the description must start with a tab character. The item description must end with a full stop '.'.

The registration information file is terminated with a line containing the string '###END###'.

The content of each section in the registration information file is described in the subsections below. The text that the submitter of the document is expected to provide is described in *italics*.

The information item 'Status' is required for parameters and parameter values. Normally the value is 'Required' indicating that all user agents for the application type must handle the parameter according to the description. 'Optional' indicates that the parameter does not have to be implemented, but an implementation must be done according to the description. If use of the parameter is discontinued or it is replaced with some other parameter, the value must be 'Deprecated in <N>' where '<N>' is the registration version number in which this happened.

Using parameters that have to be labelled 'Optional' is not recommended. The server has no guarantee that the provisioned value has the intended effect and the bytes sent over the air may end up being totally wasted. However, in some cases documenting such parameters may still be worthwhile to provide a common basis for provisioning features that e.g. cannot be supported in some special class of client.

The 'Occurs' information item can be used to tell that the application never uses a parameter (0/0) or that a parameter must always be included in a provisioning document (e.g. 1/1).

The information item 'Default value' tells which value will be used if the parameter is not present. The value 'None' indicates that there is no explicit default value, not even the empty string "". However, the application may give a specific interpretation to the absence of a parameter (e.g. ADDRTYPE).

C.2. Identifying Information

This section must contain the following information items in the given order:

APPID: Used application identifier.

APPID type: One of the APPID types defined in this specification.

Owner: Name of the person or body maintaining the registration information file.

Contact: Name and e-mail address for inquiries about the registration information file.

Registration version:

Version of the registration information file. Updated when new parameters are added, existing parameters are deprecated or the usage of existing parameters changes. The value is a number counted from '1'.

Registration timestamp:

Time when the registration information file was modified in the format YYYY-MM-DD (year, month, day). It will change also when errors in the registration information file are corrected, although the registration version is not incremented in that case.

Application description: Brief description of the application type.

Application reference:

List of references describing the application type and/or the protocols used by it, and information on how to obtain them. The most preferred type of reference is a publicly available URL.

C.3. Well-known Parameters

This section documents which of the parameters defined in the Provisioning Content specification actually are used by an application user agent.

Only parameters occurring within the APPLICATION characteristic are expected to be listed. However, parameters occurring in other characteristics (e.g. BOOTSTRAP or PXLOGICAL) may be listed, if they have a specific meaning for the application user agent.

Use of APPID and PROVIDER-ID does not have to be explicitly documented, since these parameters are mandatory. Use of APPADDR/ADDR must be documented, but use of APPLICATION/ADDR must not be described separately, because it is equivalent to APPADDR/ADDR when it can be used. If some other parameter is not mentioned, this is equivalent to describing it with 'Occurs: 0/0'.

The description of each parameter contains the following information items in the order listed below. Each description is terminated with a line containing hyphens '-'.

Characteristic/name: Name of characteristic in which parameter occurs/name of parameter.

Status: Required/Optional/Deprecated in version.

Occurs:

The number of times the parameter may occur given as: minimum/maximum (e.g. 0/1).

The maximum value indicates the number of parameter values that all implementations of the application must be able to accept from a provisioning document.

Default value: None/"Default value in string quotes".

Used values:

List values (e.g. authentication methods) actually used by the application using string quotes "".
In the case of ACCEPT, describe which kinds of content type specifiers the application recognises.
In the case of ADDR, list the supported address types.
In the case of URI, describe which kinds of URI (e.g. absolute or relative) the application recognises.
If some specific encoding of the value (e.g. BASE64) is required, state it here.
If the values cannot be enumerated and there is no other information to provide, fill in N/A.

Interpretation:

Possible notes on the interpretation of the parameter.
If PROVIDER-ID is used also for some other purpose than distinguishing between definitions related to different application service instances, describe the expected effect.
If STARTPAGE is used, describe the expected effect.
If the Provisioning Content specification gives all the necessary information, fill in N/A.

C.4. Application-specific Parameters

This section documents the used application-specific provisioning parameters. There should be as few such parameters as possible, since the bootstrap provisioning mechanisms cannot carry a large amount of data. Ideally only parameters required to make the application operational at a basic level of functionality should be included.

The application-specific parameters and their values will also be embedded in the provisioning content as literal strings, so it is highly recommended to select reasonably short parameter names and parameter value keywords.

The description of each parameter contains the following information items in the order listed below. Each description is terminated with a line containing hyphens '-'.

Characteristic/name:

Name of characteristic in which parameter occurs/name of parameter. The name of the parameter is case-sensitive.

Status: Required/Optional/Deprecated in version.

Occurs:

The number of times the parameter may occur given as: minimum/maximum (e.g. 0/1).
The maximum value indicates the number of parameter values that all implementations of the application must be able to accept from a provisioning document.

Default value: None/"Default value in string quotes".

Format:

Define the format of the parameter values. Preferably reference an applicable specification. For example, URI [RFC2396] or e-mail address [RFC822]. If some specific encoding of the value (e.g. BASE64) is required, state it also here.
If the values are keywords with an arbitrary format, fill in 'See Used values'.

Used values:

List values actually used by the application using string quotes "".
If the values cannot be enumerated, use N/A (not applicable) as the item description.

Interpretation:

Describe the intended effect of the parameter as accurately as possible. Refer to the listed application references as needed. The effect of individual parameter values is intended to be described in the Parameter Values section.

C.5. Parameter Values

This section documents the effects of specific parameter values.

The description of each parameter value contains the following information items in the order listed below. Each description is terminated with a line containing hyphens '-'.

Characteristic/parameter/value:

Name of characteristic/name of parameter/ parameter value. The value strings are case-sensitive.

Status: Required/Optional/Deprecated in version.**Interpretation:**

Describe the intended effect of the parameter value as accurately as possible. Refer to the listed application references or other applicable references (e.g. RFCs) as needed.

C.6. Example of a Registration Information File

This is a hypothetical example. The actual registration of the application type may be different.

IDENTIFYING INFORMATION

#####

#####

```
<characteristic type="APPLICATION">
  <parm name="APPID" value="w4"/>
  <parm name="NAME" value="Operator MMS"/>
  <parm name="ADDR" value="http://mms.operator.com/mmsc"/>
</characteristic>
```

##END##

Appendix D. Encoding of provisioning documents (Informative)

This section gives an example of an encoded provisioning document. It is the document in example 1, section 6.1, that is encoded. Encoding rules are defined in [WBXML] and [WSP], but to simplify reading some of the rules are presented here as well:

- Encoding of a *short integer* require the most significant bit to be set, i.e. 1xxx xxxx
- If an element includes attributes the most significant bit should be set to 1
- If an element includes content the next to most significant bit should be set to 1

The encoded header and document is presented in logical fractions of the token stream together with appropriate descriptions.

If SEC is set to USERPIN and USERPIN equals 1234 the following encoding of the WSP header and the provisioning document in example 1 will apply:

<u>Token stream</u>	<u>Description</u>
<u>0106</u>	WSP header, see [WSP] chapter 8.2: TID (01), PDU Type Push (06)
<u>2f</u>	Headers length, see [WSP] chapter 8.2.4.
<u>1f2d</u>	Content type value length given as "Length-quote Length", see [WSP] chapter 8.4.2.2.
<u>b6</u>	The assigned number for the media type application/vnd.wap.connectivity-wbxml is 36 [WINA]. This is encoded as a <i>short integer</i> , see [WSP] chapter 8.4.2.1.
<u>9181</u>	Assigned number for the well-known parameter SEC is 11, see [WSP] table 38. This is encoded as a <i>short integer</i> . Chosen security method is USERPIN (1), encoded as a <i>short integer</i> .
<u>92</u>	Assigned number for the well-known parameter MAC is 12. This is encoded as a <i>short integer</i> .
<u>30424233424235353146</u> <u>3041393333539454332</u> <u>39453643454143313434</u> <u>30453441363137343839</u>	The MAC value, 40 bytes.
<u>00</u>	End-of-string for the encoded MAC value.
<u>03</u>	WBXML version 1.3, see [WBXML] chapter 5.4.
<u>0b</u>	The Public Identifier for "-//WAPFORUM//DTD PROV 1.0//EN" [WINA].
<u>6a</u>	Character set UTF-8, see [WBXML] chapter 5.6. MIBEnum for this is 106 [IANA]. In hexadecimal that is 6a.

<u>05</u>	<u>String table length = 05, see [WBXML] chapter 5.7.</u>
<u>4e41503100</u>	<u>String table: 'N', 'A', 'P', '1', 00</u>
<u>c5</u>	<u>Element wap-provisioningdoc includes attribute and content.</u>
<u>46</u>	<u>Attribute version (46, version 1.0).</u>
<u>01</u>	<u>End of attribute list.</u>
<u>c65101</u>	<u>Characteristic (06) PXLOGICAL (51) includes attribute and content (11xx xxxx) and is ended by an end of attribute list.</u>
<u>871506</u>	<u>Parameter (07) PROXY-ID (15) includes attribute but no content (10xx xxxx). The attribute is the value (06) attribute.</u>
<u>033137302e3138372e35312e340001</u>	<u>The value is an inline string (03), "170.187.51.4". Ends with an end of string (00) and an end of attribute list (01).</u>
<u>8707060342616e6b4d61696e50726f78790001</u>	<u>Parameter (07) NAME (07) with attribute (10xx xxxx) value (06), the inline string (03) "BankMainProxy" (42616e6b4d61696e50726f7879). End of string (00) and end of attribute list (01) ends the token stream.</u>
<u>871c0603687474703a2f2f7777772e62616e6b2e636f6d2f7374617274706167652e776d6c0001</u>	<u>Parameter STARTPAGE carrying the inline string value "http://www.bank.com/startpage.wml".</u>
<u>c65901</u>	<u>Characteristic PXAUTHINFO with attribute and content.</u>
<u>8719069c01</u>	<u>Parameter PXAUTH-TYPE carrying the value "HTTP-BASIC".</u>
<u>871a06037078757365726e616d650001</u>	<u>Parameter PXAUTH-ID carrying the inline string value "pxusername".</u>
<u>871b06037078757365727061737377640001</u>	<u>Parameter PXAUTH-PW carrying the inline string value "pxuserpasswd".</u>
<u>01</u>	<u>End of attribute list, i.e. end of characteristic PXAUTHINFO.</u>
<u>c65201</u>	<u>Characteristic PXPHYSICAL with attribute and content.</u>
<u>872f060350524f585920310001</u>	<u>Parameter PHYSICAL-PROXY-ID carrying the inline string value "PROXY 1".</u>
<u>871706037777772e62616e6b2e636f6d2f0001</u>	<u>Parameter DOMAIN carrying the inline string value "www.bank.com/".</u>
<u>872006033137302e3138372e35312e330001</u>	<u>Parameter PXADDR carrying the inline string value "170.187.51.3".</u>
<u>8721068501</u>	<u>Parameter PXADDRTYPE carrying the value "IPV4".</u>
<u>87220603494e5445524e45540001</u>	<u>Parameter TO-NAPID carrying the inline string value "INTERNET".</u>
<u>872206830001</u>	<u>Parameter TO-NAPID with string table reference to "NAP1", i.e. offset value 0, see [WBXML] chapter 5.7.</u>
<u>c65301</u>	<u>Characteristic PORT.</u>

<u>87230603393230330001</u>	Parameter PORTNBR carrying the inline string value "9203".
<u>01</u>	End of characteristic PORT.
<u>01</u>	End of characteristic PXPHYSICAL.
<u>01</u>	End of characteristic PXLOGICAL.
<u>c65501</u>	Characteristic NAPDEF.
<u>871106830001</u>	Parameter NAPID with string table reference to "NAP1".
<u>871006aa01</u>	Parameter BEARER carrying the value "GSM-CSD".
<u>870706034d5920495350 204353440001</u>	Parameter NAME carrying the inline string value "MY ISP CSD".
<u>870806032b3335383038 3132343030320001</u>	Parameter NAP-ADDRESS carrying the inline string value "+35808124002".
<u>8709068701</u>	Parameter NAP-ADDRTYPE carrying the value "E164".
<u>870a069001</u>	ParameterCALLTYPE carrying the value "ANALOG-MODEM".
<u>c65a01</u>	Characteristic NAPAUTHINFO.
<u>870c069a01</u>	Parameter AUTHTYPE carrying the value "PAP".
<u>870d0603777776d6d6d 757365720001</u>	Parameter AUTHNAME carrying the inline string value "wwwmmuser".
<u>870e0603777776d6d6d 7365637265740001</u>	Parameter AUTHSECRET carrying the inline string value "wwwmmsecret".
<u>01</u>	End of characteristic NAPAUTHINFO.
<u>c65401</u>	Characteristic VALIDITY.
<u>871206033232380001</u>	Parameter COUNTRY carrying the inline string value "228".
<u>871306033030310001</u>	Parameter NETWORK carrying the inline string value "001".
<u>01</u>	End of characteristic VALIDITY.
<u>01</u>	End of characteristic NAPDEF.
<u>01</u>	End of element wap-provisioningdoc, i.e. end of provisioning document.
